Protein Sequence Searches - February 2005

All of the sequence databases on ABSS have recently been updated.

- permanent accession numbers. The new UniProt record may not contain the previous temporary numbers from the most recent version of UniProt. These sequences have been assigned new Please note that the curators of the UniProt database have purged some temporary accession accession number.
- extension .rup) that can no longer be found in the database, the permanent record with the new accession number can be found by searching the old accession number in the UniProt Protein. If you encounter an accession number from an older search run against UniProt (results file Archive database (UniPARC) at:

http://www.pir.uniprot.org/database/archive.shtml

If you have any questions regarding this information or your results, please contact any STIC searcher.

members of the public who may encounter UniProt temporary accession When submitting sequence search results for scanning into IFW, please include a copy of this attachment to assist any future Examiners or numbers.

Patent No. 6649742
GENERAL INFORMATION:
APPLICANT: Better, Marc D.
APPLICANT: Garcil, Stephen F.
APPLICANT: Studnika, Gary M.
TITLE OF INVENTION: Immunotoxins Comprising Ribosome-Inactivating TITLE OF INVENTION: Proteins
NUMBER OF SEQUENCES: 169
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                11022US09/200-70.P3.C3

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A)Title: The complete amino acid sequence of an abortifacient protein, karasurin.
                                                                                                                                                   abrin (clone 7.2) precursor - Indian licorice (fragment)
N;Contains: rRNA N-glycosidase (EC 3.2.2.2)
C;Species: Abrus precarcorius (Indian licorice)
C;Accession: C39761; 514471

Title: Perfect score: Sequence:

US-10-717-243-101 1277 1 GLDTVSFSTKGATYITYVNF......AVDQVKPKIALLKFVDKDPK 251

Scoring table:

BLOSUM62 Gapop 10.0 , Gapext 0.5

827211 Total number of hits satisfying chosen parameters: 1612378 seqs, 512079187 residues Searched:

Minimum DB seq length: 0 Maximum DB seq length: 251

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MIS.-L., Wang Y., Li Y.-Y., Chen Z.-L., An C.-C.;

"Trichosanthes kirilowii trichosanthin (TCS) mature peptide gene.";

"Trichosanthes kirilowii trichosanthin (TCS) mature peptide gene.";

Submitted (UNN-2004) to the EMBL/GenBank/DDBJ datubases.

-I CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.

-I SIMILARITY: Belongs to the ribosome-inactivating protein family.

EMBL; AY668811; AAT91090.1; -.

derived by site-specific mutagenesis in Escherichia coli.";
Blur. J. Blochem. 219:38-87(1994).
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one
specific adenosine on the 28S rRNA.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Eur. J. Biochem. 219:83-87(1934).
-1- CATALYTIC ACTIVITY: Endohydrolygis of the N-glycosidic bond at one
-!- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rRNA.
-!- SIMILARITY: Belongs to the ribosome-inactivating protein family.

Submitted (APR-2003) to the EMBL/GenBank/DDBJ databases.

- CATALTYTTC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 258 rRNA.

- SIMILARITY: Belongs to the ribosome-inactivating protein family.

Submitted (APR-2003) to the EMBL/GenBank/DDBJ databases.

C. -- CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at one specific adenosine on the 28S rENA.

C. -- SIMILARITY: Belongs to the ribosome-inactivating protein family.

-!-CATALYTIC ACTIVITY: Endohydrolysis of the N-glycosidic bond at o specific adenosine on the 28S rRNA.
-!-SIMILARITY: Belongs to the ribosome-inactivating protein family.

Polynucleotide(s) encoding type I ribosome-inactivating proteins - are suitable for use as components of cytotoxic therapeutic agents. Type I ribosome-inactivating proteins; RIPs; gelonin; cytotoxic therapeutic agents; autoimmune disease; cancer; graft-versus-host disease. Type I RIP gelonin analog Gel (A44/A50) Better MD, Carroll SF, Studnicka GM; AAR63914 standard; protein; 251 AA 94WO-US005348 93US-00064691 (revised)
(first entry) Gelonium multiflorum WPI; 1995-006804/01 (XOMA) XOMA CORP. 12-MAY-1994; 12-MAY-1993; WO9426910-A1 24-NOV-1994. 25-MAR-2003 27-JUL-1995

AAR63912-R63924 are analogs of AAR63903 type I ribosome-inactivating protein (RIP) gelonin, one of the nine RIPs described in AAR63903-R63911. RIPs are key components of cytotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)

RIPB are key components of cytotoxic therapeutic agents (CTAB), which include gene fusion products and immunoconjugates. CTAB may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-WAR-2003 to correct PN field.)

RIPs are key components of cytctoxic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. The sty components of cytocoxic therapeutic agents (CTAB), which include gene fusion products and immunoconjugates. CTAB may be used to selectively eliminate any cell type to which a RIP component is tragetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to

```

```
The invention describes an isolated peptide or polypeptide having an anti-
tumour and antiviral activity. Also described is a composition
comprising the isolated peptide or polypeptide, and a carrier, excipient
or auxiliary agent. Specifically claimed are MAP30 or GAP31 peptides or
polypeptides. The peptide or polypeptide is useful for treating HIV
infection, and tumour. This is the amino acid sequence of Gelonium anti-
HIV protein 30kDa (MAP30).
           antiviral; MAP30;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New MAP30 or GAP31 peptides or polypeptides having an anti-tumor and antiviral activity, useful for treating human immunodeficiency virus
anti-HIV; cytostatic; peptide therapy; anti-tumour; GAP31; HIV; tumour; gelonium anti-HIV protein 31kba.

RIPs are key components of cytotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to correct PN field.)

RIPs are key components of cytotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune correct PN field.)

RIPs are key components of cytotoxic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is trargetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Polynucleotide(s) encoding type I ribosome-inactivating proteins - which are suitable for use as components of cytotoxic therapeutic agents.

RIPs are key components of cytocoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        240

RIPs are key components of cytocoxic therapeutic agents (CTAS), which include gene fusion products and immunoconjugates. CTAS may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the

RIPs are key components of cytotoxic therapeutic agents (CTAB), which include gene fusion products and immunoconjugates. CTAB may be used to selectively eliminate any cell type to which a RIP component is
                                                                                                                                                           9
                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polynucleotide(s) encoding type I ribosome-inactivating proteins - which are suitable for use as components of cytotoxic therapeutic agents.
the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 correct PN field.)

selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 to

       selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can be used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host disease. (Updated on 25-MAR-2003 correct PN field.)

Better MD;

Bernhard SL,

Lane JA,

polypeptides that share the ribosome-inactivating activity of the natural protein but differ in AA sequence. Preferred analogues have a Cys available for disulfide bonding located at a posn. it its AA sequence from the posn. corresp. to posn. 251 in ricin A-chain RTA to the carboxy terminus of the analogue. (AAR74176 is the sequence of ricin A-chain RTA, which is a Type II RIP). The primary AA sequence of the Type I RIPS colonin, BRIP, mormordin II, luffin [see Islam et al. Agricultural gelonin, BRIP, mormordin II, luffin [see Islam et al. Agricultural cological Chem., 265, 8670-74 1990], momordin I [see Hobe et al., BBA, 1088, 311-14 1991], Mirabilis antiviral protein [see Hobe et al., J. Biol. Chem., 264(12) 5659-37 1989], pokeweed antiviral protein isolated from seeds [see Kung et al., Agric. Biol. Chem., 54(12), 3301-18 1990] and saporin [see Banatti et al., Eur. J. Biochem., 183, 465-70 1989] are individually aligned with the primary sequence of the ricin A-chain [see Halling et al., Nucleic Acids Res., 13, 8019-803, 1985] respectively in Figures 1-9. The AAS invariant among the ricin A-chain and the Type I RIPS are indicated in FT. Also indicated are the preferred sites of Cys substitution. It is also preferred that the gelonin cysteine residues at positions 44 and 50 be replaced with alanine residues. (Updated on 25-MAR 2003 to correct PR field.) Analogues of Type I RIP are defined as non-naturally occurring polypeptides that share the ribosome-inactivating activity of the natural

Sequence 251 AA;
